Seung Jae Lim

I worked with Patrick McGrath.

In this project, I have worked on sorting a string. This takes account of many errors possible if all was found between me and my partner. This includes extra spaces in front, end, and between all the words or tokens. All non-alphabetical cases are reduced to one single space. Then, this takes account of words in alphabetical order where capital letters come first as well as words that are shorter in length if the word after is a concatenation of the previous. All functions are commented with very simple instructions; I think they are easy to follow.
